CACTUS Week 8: Reproduce and Present

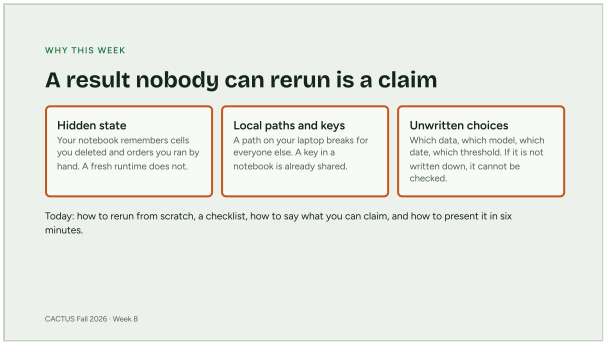

Slide 1

TIME 1 min (0:00)

SAY Welcome to the last week. We will spend 20 minutes on how to make a project rerunnable and presentable, then an hour of pairs rerunning each other's notebooks, then presentations.

DO Welcome people. Post the course site link and the rerun report link. Say the order of the day: this short session, swap and rerun, a break, then presentations.

NOTE This is a 20-minute session. The work is in the next two parts.

Slide 2

TIME 3 min (0:01 to 0:04)

SAY A result you cannot rerun is a claim, not a finding. There are three usual reasons. Hidden state: your notebook remembers cells you deleted and orders you ran by hand. Local paths and keys: a path on your laptop breaks for everyone else, and a key in a notebook is already shared. Unwritten choices: which data, which model, which date, which threshold.

DO Read the three cards. Ask: who has ever opened an old notebook and found it would not run? Take two hands.

WATCH FOR People who hear this as a criticism. Say that every notebook has this problem until you test it.

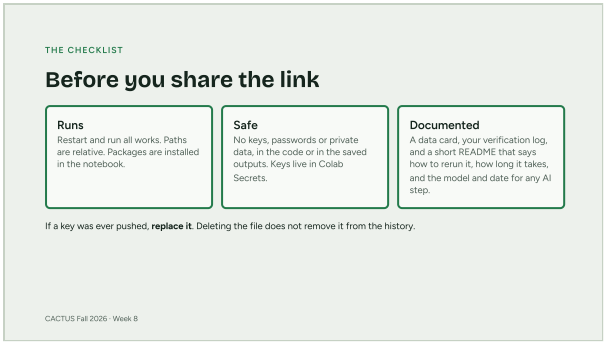

Slide 3

TIME 4 min (0:04 to 0:08)

SAY The test is simple. In Colab, Runtime, Restart session and run all. The first error is the finding. Then have someone else do it, with only the notebook and the README. Whatever breaks for them would have broken for any reader.

DO (live demo, optional) open a small notebook with one deliberately broken cell, restart and run all, and read the first error aloud. Show how the error points at the cause. If you do not have one ready, describe the two example errors on the slide.

IF ASKED about a very long notebook run it on a small sample first, then the full thing.

Slide 4

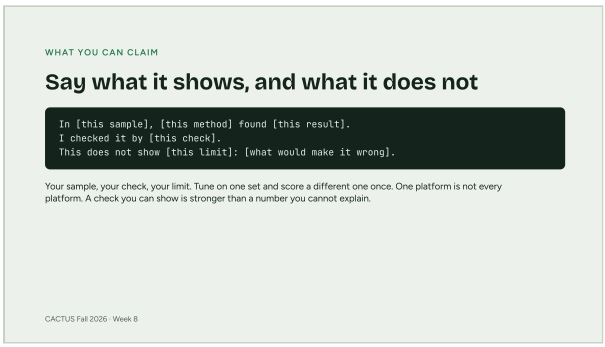

TIME 4 min (0:08 to 0:12)

SAY Before you share a link: it runs (restart and run all works, paths are relative, packages are installed in the notebook); it is safe (no keys or private data, in the code or in the saved outputs, and keys live in Colab Secrets); and it is documented (a data card, your verification log, and a short README that says how to rerun it, how long it takes, and the model and date for any AI step).

DO Say the key point loudly: if a key was ever pushed, replace it. Deleting the file does not remove it from the history.

IF ASKED about ethics or data sharing say that is a good question for your supervisor, and Kokil is the ethics contact for CACTUS.

WATCH FOR Saved outputs. People check the code and forget that printed tables can contain names or handles.

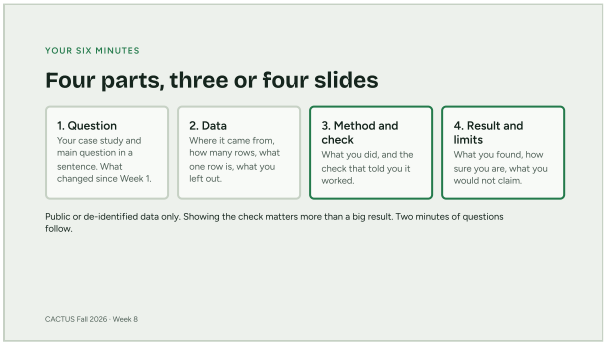

Slide 5

TIME 4 min (0:12 to 0:16)

SAY Say what your result shows and what it does not. The frame on the slide: in this sample, this method found this; I checked it by this; this does not show that, and here is what would make it wrong. Tune on one set and score a different one once. One platform is not every platform. A check you can show is stronger than a number you cannot explain.

DO Ask the room to say one limit of their own project aloud. Take two.

WATCH FOR Claims that go beyond the sample, and 'proves' or 'causes'.

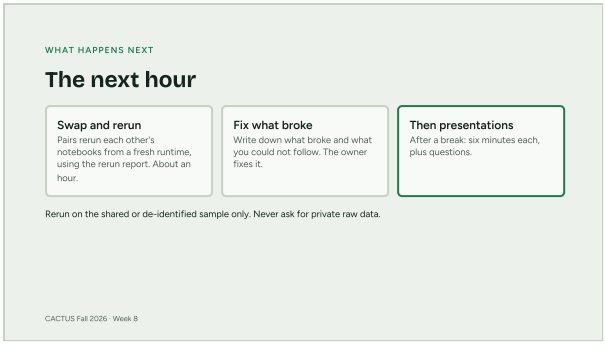

Slide 6

TIME 3 min (0:16 to 0:19)

SAY Your presentation is six minutes, plus two for questions. Four parts: the question, the data, the method and the check, and the result and its limits. Three or four slides. Public or de-identified data only. The check matters more than a big result.

DO Say what we look for: a clear question, data described honestly, at least one check you can show, claims that match the evidence, and a notebook someone else could rerun. Say the Desk will give a warning at five minutes.

WATCH FOR People planning too much. Say that one clear idea beats five.

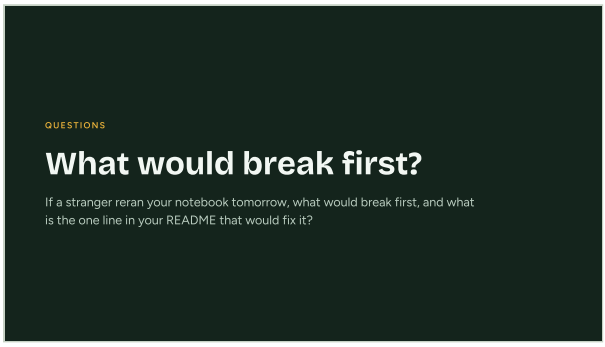

Slide 7

TIME 1 min (0:19 to 0:20)

SAY Next is an hour of pairs rerunning each other's notebooks from a fresh runtime, using the rerun report. Write down what broke and what you could not follow, and the owner fixes it. After a break, the presentations.

DO Say the pairs and post the link to the rerun report template. Say the rule: partners rerun on the shared or de-identified sample only, never on private raw data. Send people to their pairs.

Slide 8

TIME remaining

SAY If a stranger reran your notebook tomorrow, what would break first, and what is the one line in your README that would fix it?

DO Take a minute of questions, then send people to their pairs. If you do not know an answer, say so and write it down.
